

The EUSO-Super Pressure Balloon

Valentina Scotti
INFN Sezione di Napoli

Extreme Universe Space Observatory

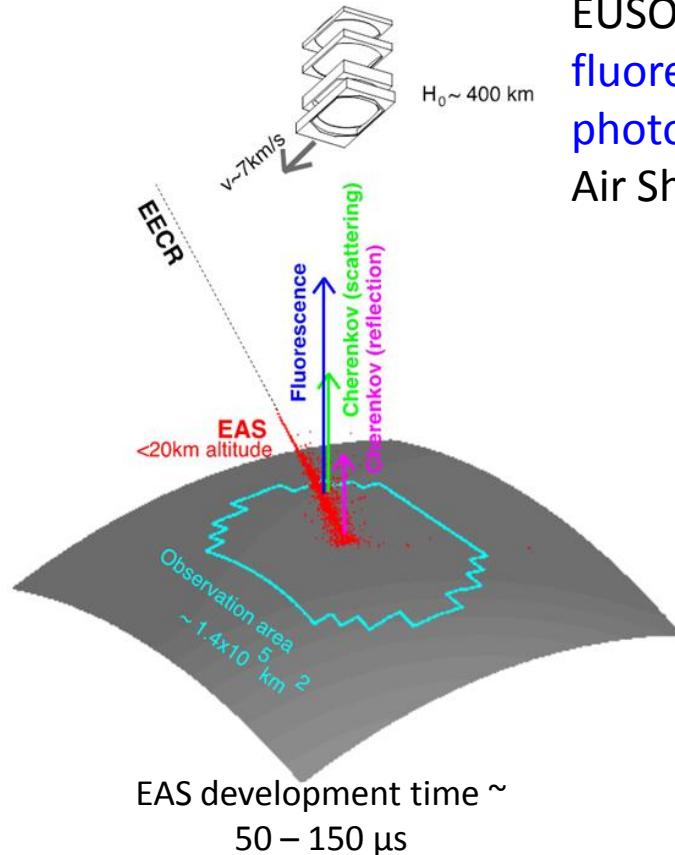

EUSO: the main idea

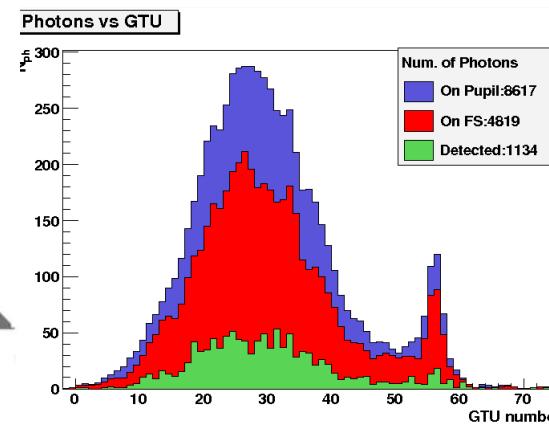

Observing from space transient luminous phenomena occurring in the Earth's atmosphere

Main objective: study the **Extreme Energy Cosmic Rays**

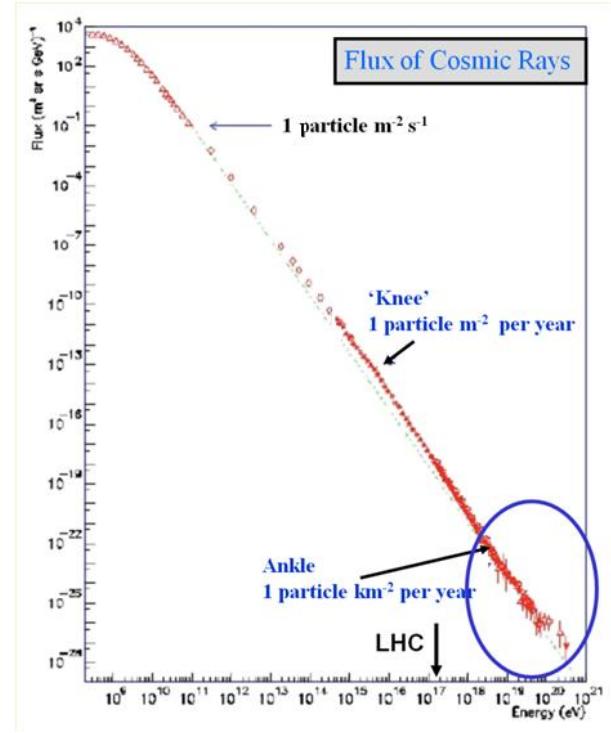

EECR: $E > 5 \times 10^{19}$ eV

EUSO telescope will observe **fluorescence and Cherenkov UV photons** generated by Extensive Air Showers created by EECR

Simulation of the light profile observed at the entrance pupil and through the instrument

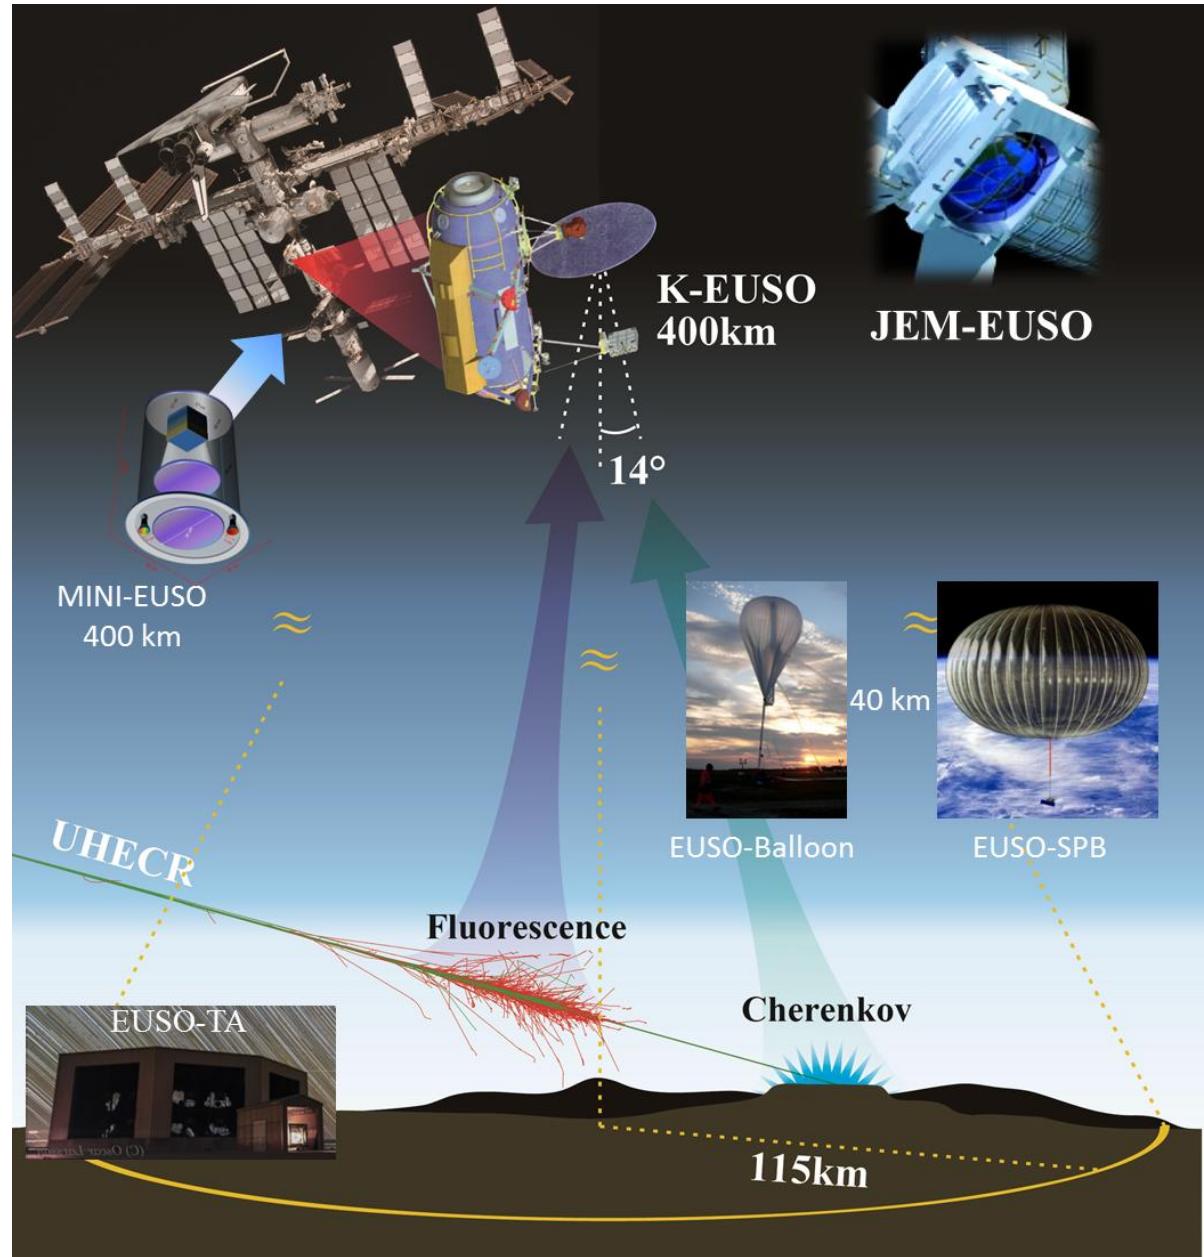

Main advantages:

1. The target volume is far greater than possible from the ground
2. Full sky coverage

First idea: J. Linsley, late '70

The EUSO program: cosmic rays from space

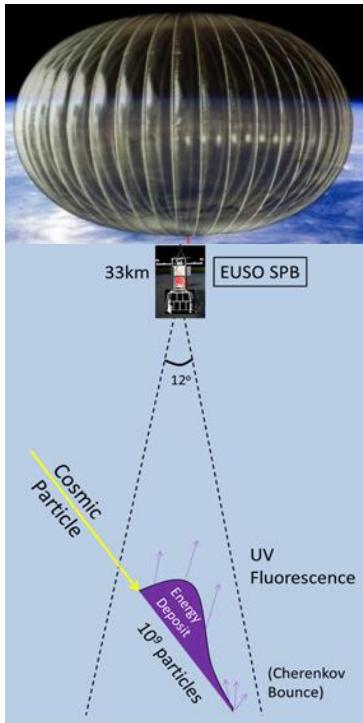

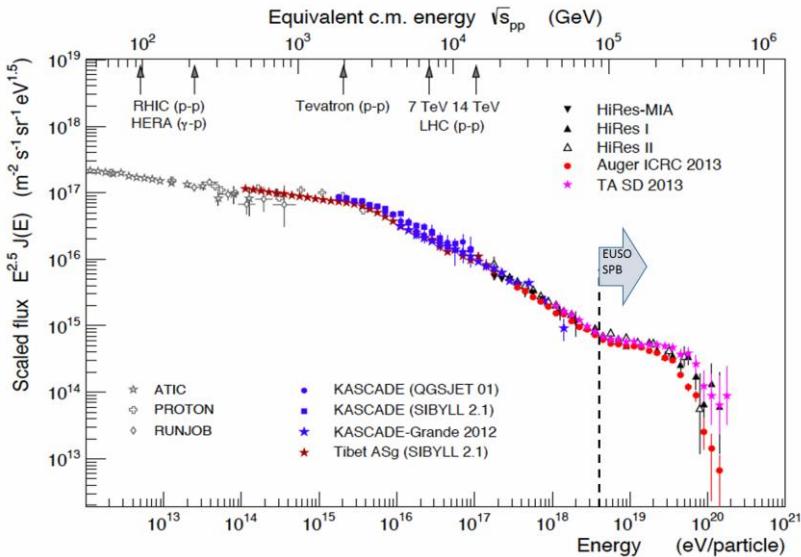

1. **EUSO-TA**: ground detector installed in 2014 at Telescope Array site (USA), currently operational
2. **EUSO-Balloon**: 1st flight from Timmins, (Canada) by the French Space Agency) in August 2014.
3. **EUSO-SPB**: NASA Ultra long duration flight from Wanaka (New Zealand); launched in April 2017
4. **MINI-EUSO** (2018): precursor on International Space Station (ISS) approved by Italian and Russian Space agencies; launch foreseen in 2017
5. **K-EUSO**: bigger telescope on ISS, approved by Russian Space Agency; launch in 2019

EUSO-Super Pressure Balloon

Scientific objectives

1. First fluorescence observations of cosmic ray from above
2. Measure UV background light at night from space
3. Search for faint and ultrafast UV signatures in the atmosphere from other phenomena
4. Establish methods and techniques for a future high energy astroparticle space observatory

SPB Float Height	110,000 ft = 33.5 km
Weight	
Detector	2250 lbs
Payload	2700 lbs w/ SIP, Antennas, Empty Ballast Hoppers
Dimensions	1.2m x 1.2m x 3m
Power consumption	40 W Day, 70 W Night (assumes 20W PDM heater @ 50%)
Telescope	Refractor with 2 Fresnel lenses
FOV	11. deg (measured w/ stars)
Camera:	2,304 pixels; 36 MAPMTS (Hamamatsu R11265-113-M64-MOD2)
Data volume:	Downlinked ~1-1.5 Gb/day
Recorded	~3 GB/Day w/ 10 hour dark run with trigger rate of 0.2 Hz
Energy threshold	for h=33 km ~3 EeV
Ground equivalent Trigger Aperture	250 km^2sr @ 3 EeV to ~500 km^2 sr @ 10 EeV

EUSO-SPB instrument

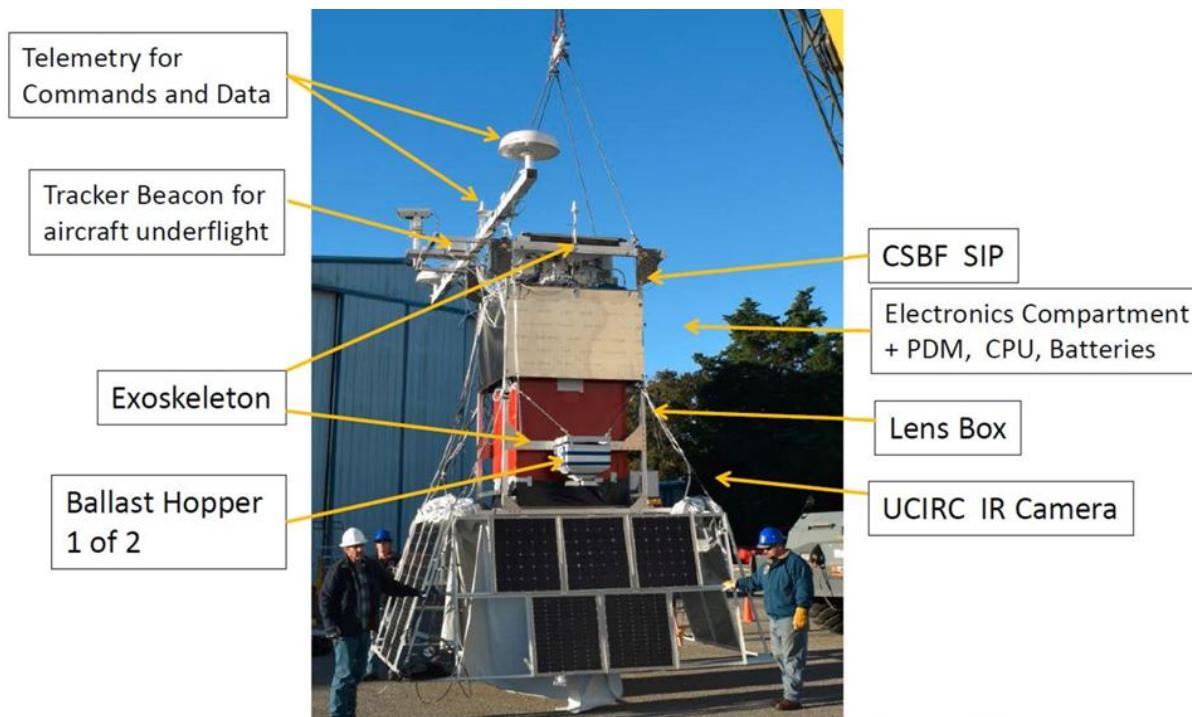

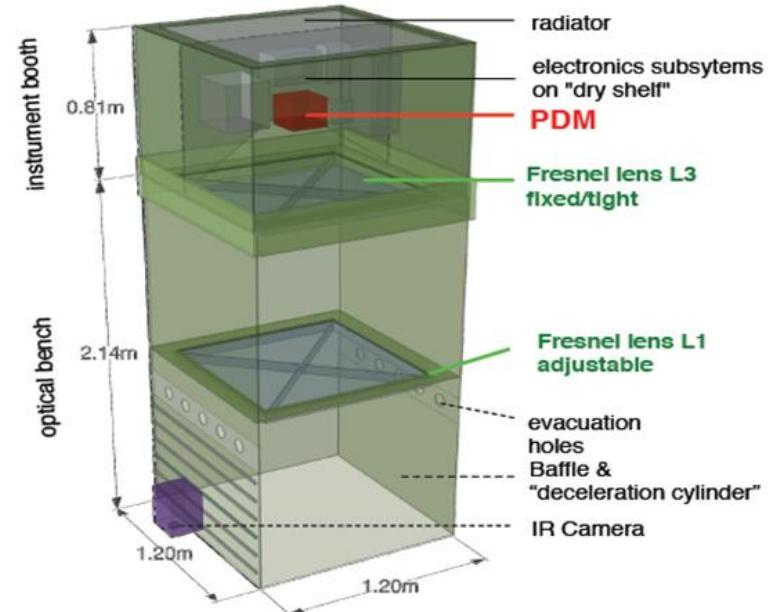

Optics: 2 $\Phi 1\text{m}$ Fresnel type lenses
+ UV filter (330-400 nm)
 $\text{FoV} = \pm 5.5^\circ$

Photo Detector Module: array of 36 Multi-Anode PhotoMultiplier Tubes (MAPMTs) of 64 pixels
2304 channels in total

Data Processor: readout performed by one ASIC per MAPMT + multiple trigger levels to filter out noise and identify events of interest

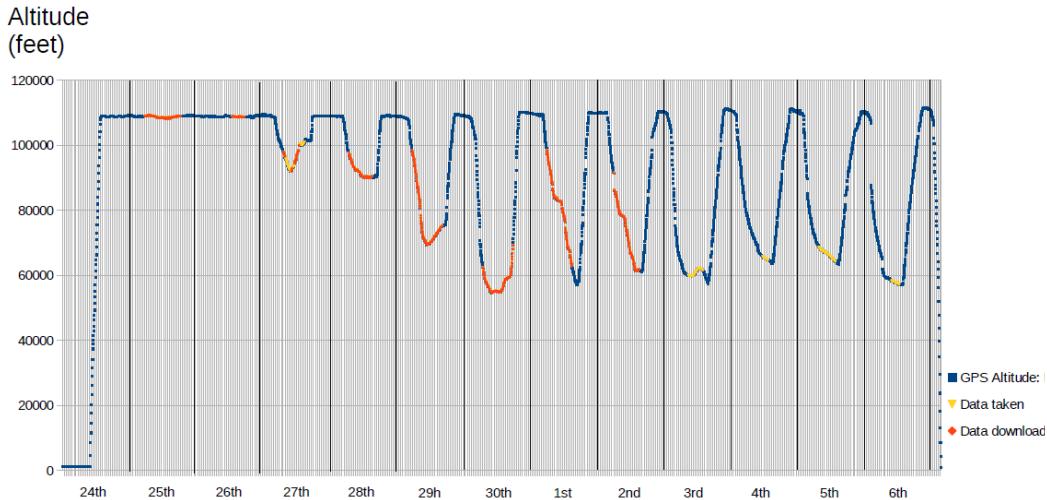

+ an **infrared camera** to provide complementary information on the observation conditions

+ a **SiPM Photo Detector** in a dedicated box (talk by M. Renschler)

The first EUSO-SPB flight

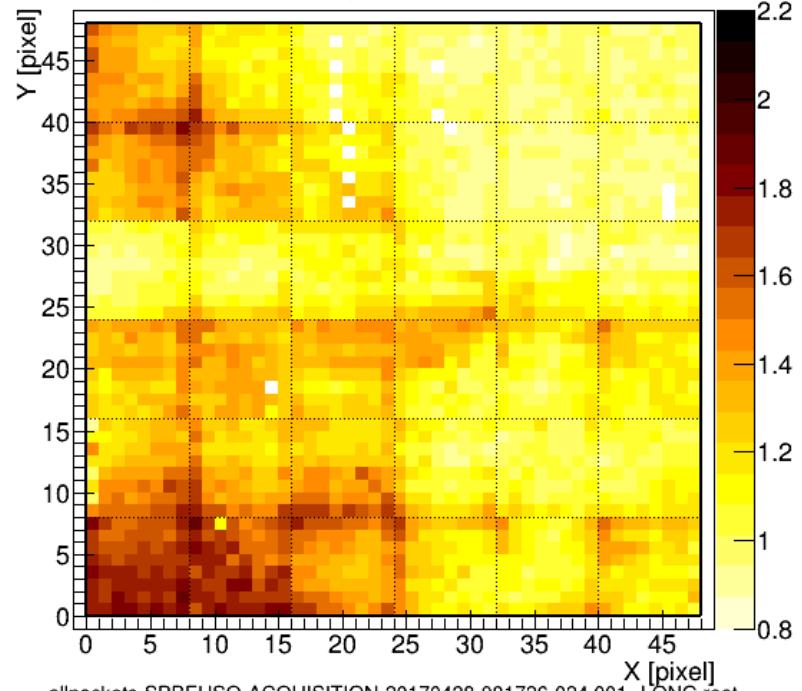

- launched from Columbia Scientific Balloon Facility base in Wanaka (NZ) on 24/4/17 at 22:50
- 12 days, 4 hours and 34 minutes aloft
- more than 60 GB of data downloaded to ground

	Data Taken	Data downloaded
Per day	0425: 34 min 0426: 100 min 0427: 276 min 0428: 370 min 0429: 338 min 0430: 304 min 0501: 172 min 0502: 330 min 0503: ~200 min 0504: 206 min 0505: 212 min 0506: 138 min	0425: 34 min 0426: 100 min 0427: 160 min 0428: 370 min 0429: 338 min 0430: 304 min 0501: 172 min 0502: 330 min
Total	2500 min → 41.7 h	1828 min → 30h
