Milne-Eddington inversion codes

Luis Bellot Rubio

Instituto de Astrofísica de Andalucía (IAA-CSIC), Spain

Outline

- What are inversions?
- How do they work?
- Milne-Eddington inversions
- Available codes
- Tips and tricks

- P-MILOS
 - General description
 - Input/output files
- Example

What is an inversion?

- In a broad sense, any inference of the physical conditions of the solar atmosphere based on the interpretation of observed Stokes profiles
 - Weak-field approximation, center-of-gravity method...
 - Forward modeling
 - PCA, artificial neural networks
 - Least-squares fitting
- **What we want:** vector magnetic field, gas velocity, temperature
- What to expect: a model atmosphere capable of reproducing the observations.... **nothing else!**

Radiative transfer equation

- The Stokes parameters obey the RTE

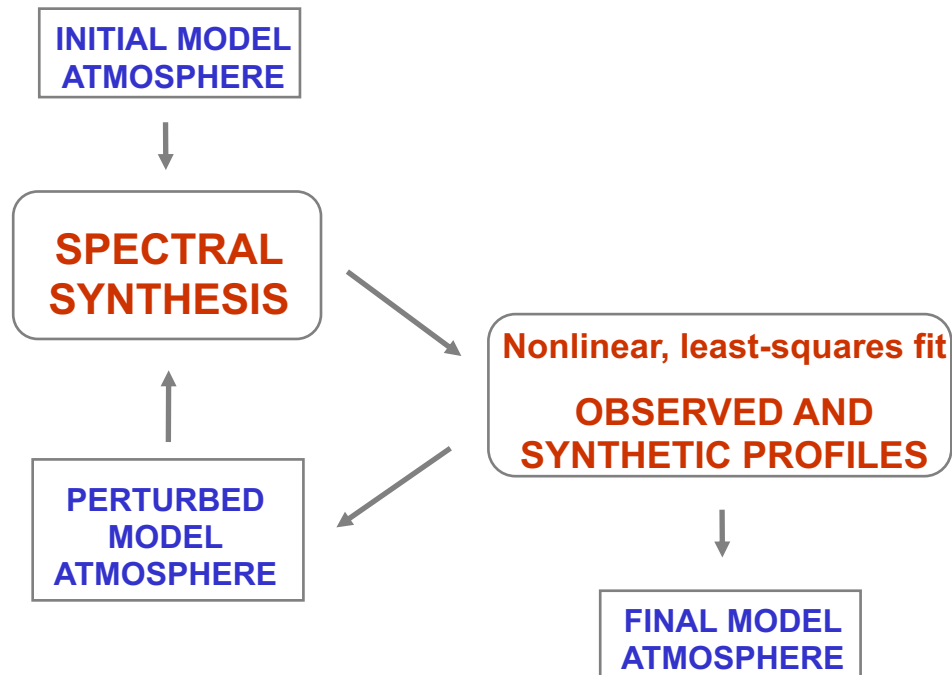

$$\frac{d}{d\tau} \begin{pmatrix} I \\ Q \\ U \\ V \end{pmatrix} = \begin{pmatrix} \eta_I & \eta_Q & \eta_U & \eta_V \\ \eta_Q & \eta_I & \rho_V & -\rho_U \\ \eta_U & -\rho_V & \eta_I & \rho_Q \\ \eta_V & \rho_U & -\rho_Q & \eta_I \end{pmatrix} \begin{pmatrix} I - S \\ Q \\ U \\ V \end{pmatrix}$$

(Unno 1956;
Rachkovsky 1962)

- $\eta_{I,Q,U,V}$ and $\rho_{Q,U,V}$ depend on $\mathbf{a} \equiv (\mathbf{B}, \gamma, \chi, v_{\text{LOS}}, T, P_e, v_{\text{mic}})$
- This means that
 - Four Stokes parameters needed to understand just one of them
 - Proper interpretations of the Stokes vector require a good knowledge of the atmosphere (\mathbf{a})

Least-square inversions

- The complete line transfer problem has to be solved
- Self-consistent inferences → least-square inversions

Advantages

- No simplifying assumptions
- Full Stokes vector fitted
- Complex model atmospheres
- All atmospheric parameters inferred at the same time

How do they work?

- Inversion driven by χ^2 -minimization

$$\chi^2(\mathbf{a}) = \frac{1}{N_{\text{free}}} \sum_{j=1}^4 \sum_{i=1}^{N_\lambda} \frac{w_{ij}^2}{\sigma_j^2} [I_j^{\text{obs}}(\lambda_i) - I_j^{\text{syn}}(\lambda_i, \mathbf{a})]^2$$

- 2nd order Levenberg-Marquardt algorithm

$$\nabla \chi^2(\mathbf{a}) + \mathbf{A}(\chi^2) \cdot \delta \mathbf{a} = 0$$

- Matrix \mathbf{A} needs to be inverted to find $\delta \mathbf{a}$. Two problems:
 - \mathbf{A} has large dimension
 - \mathbf{A} is quasi-singular
- Two solutions:
 - Use fewer free parameters or fewer nodes
 - Modified SVD method (Ruiz Cobo & del Toro Iniesta 1992)

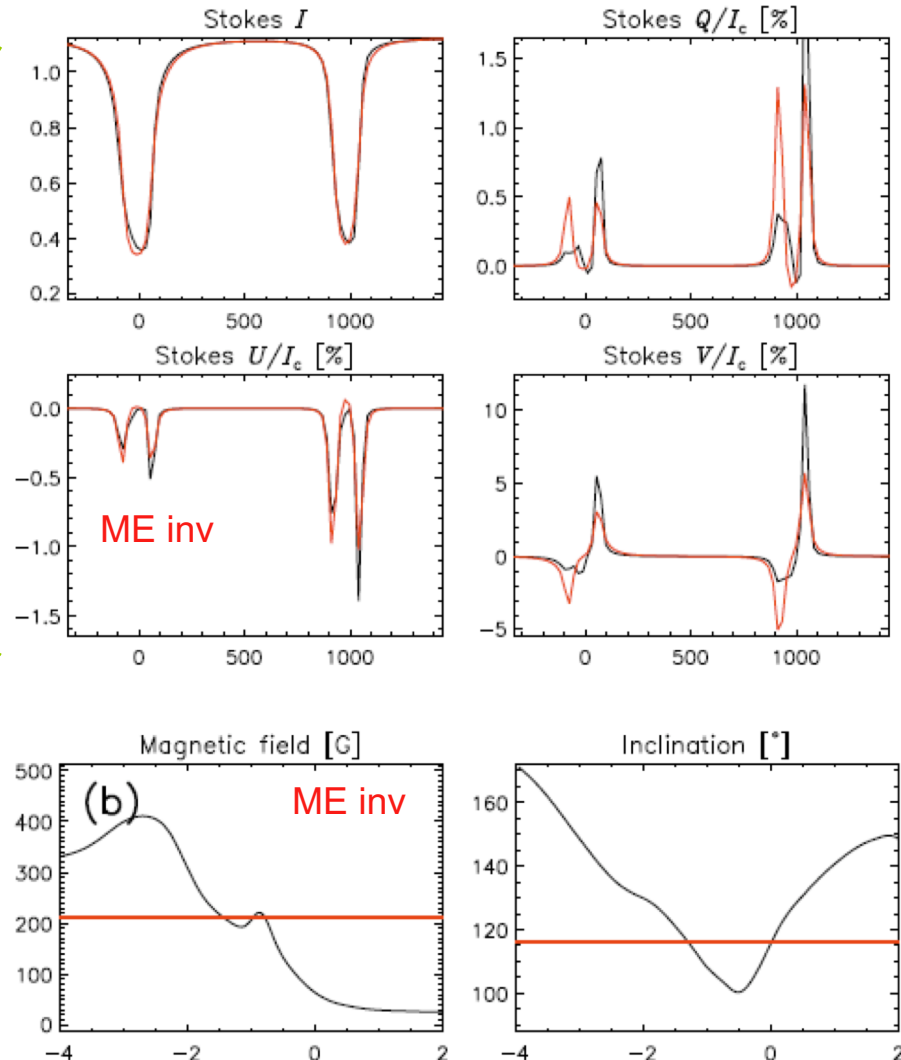

Inversions based on ME atmospheres

- ME atmosphere
 - Source function is linear with optical depth
 - Absorption matrix does not vary with optical depth
- Nine free parameters (plus v_{mac} and stray light)
- Analytical Stokes profiles

- Very fast inversion
- Smooth maps of physical quantities
- Results are reasonably accurate and easy to interpret

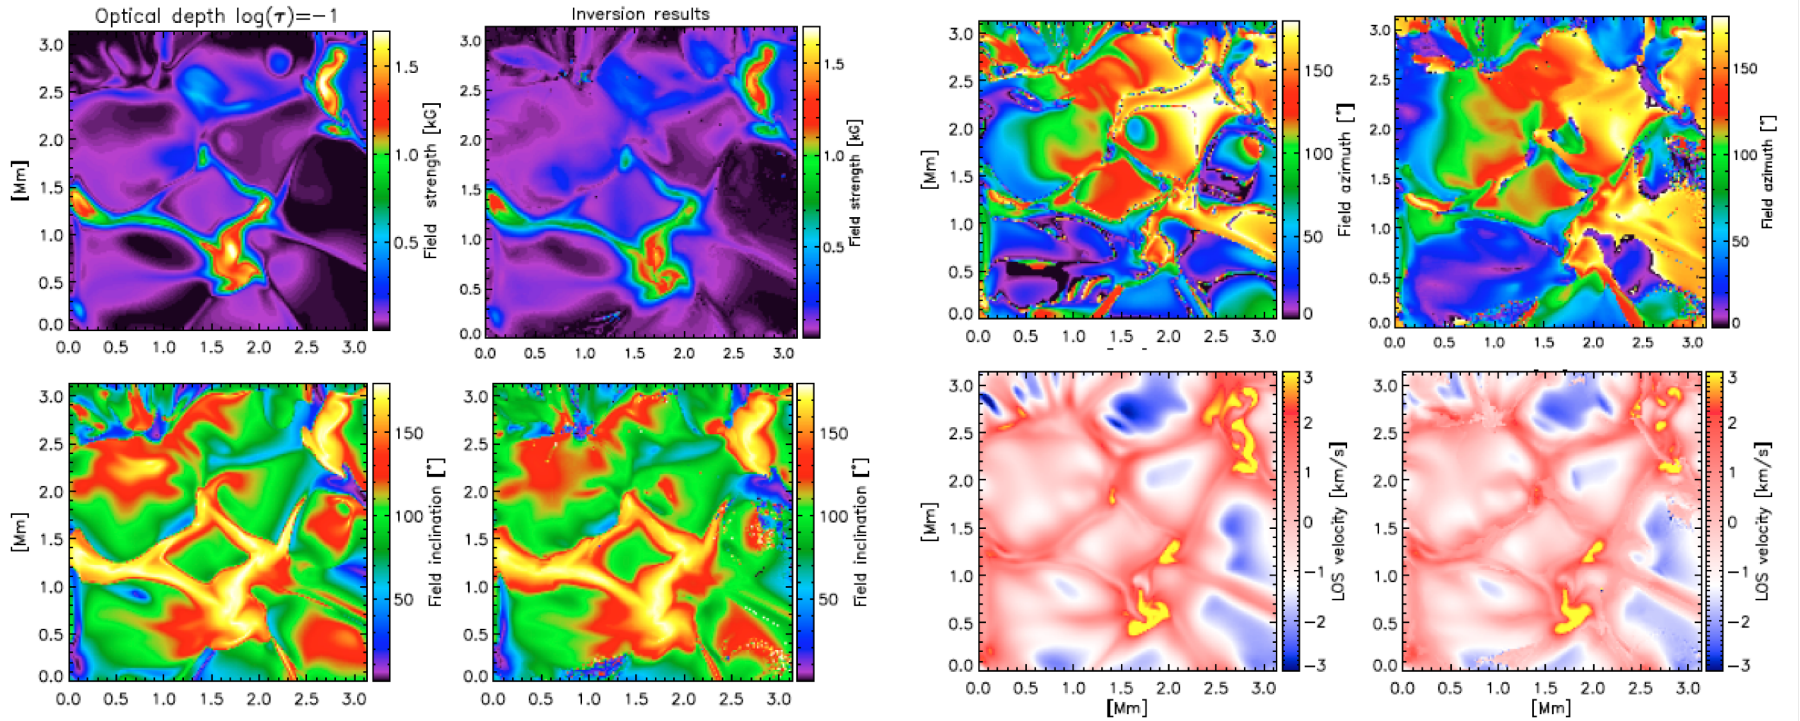

ME inversions of high-spatial resolution profiles

MHD simulations (Vögler et al. 2005)

- Profiles reasonably well fitted
- ME results are some kind of “average” of physical parameters along the LOS

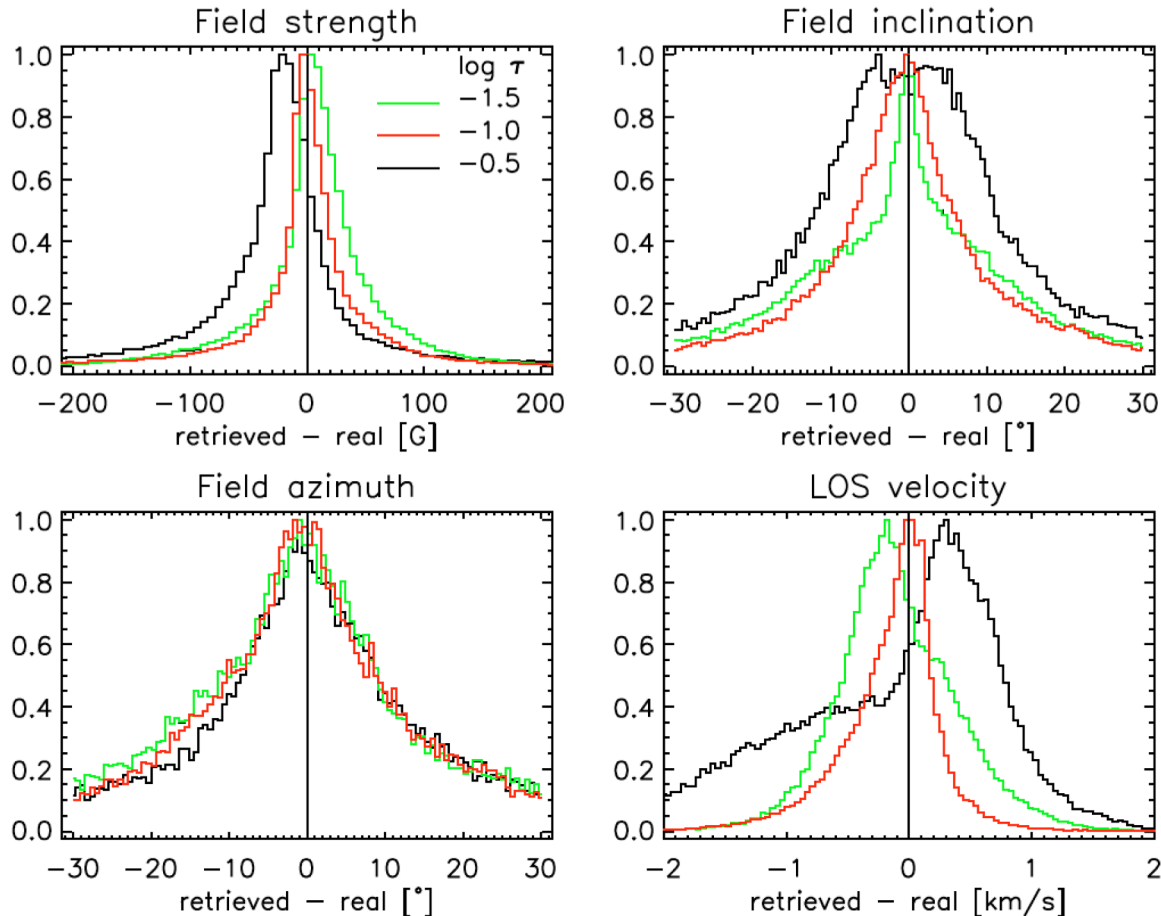

ME inversions of high-spatial resolution profiles

- Atmospheric parameters from MHD simulation at $\log \tau = -1$
- Maps of inferred B , γ and v_{LOS} very similar to real ones!

Orozco Suárez et al. 2010, AA, 518, A2

ME inversions of high-spatial resolution profiles

Orozco Suárez et al. 2010, AA, 518, A2

Inversions based on ME atmospheres

- ME atmosphere:
 - Source function is linear with optical depth
 - Absorption matrix does not vary with optical depth
- Nine free parameters
- Analytical Stokes profiles
- Very fast inversion
- Smooth maps of physical quantities
- Results are easy to interpret

- Simplistic treatment of line formation
- No thermal information. No height variations
- Cannot account for **asymmetric Stokes profiles**

Available Stokes inversion codes

Array of ME, LTE and NLTE inversion codes

- Serve different purposes: fast analyses vs accurate NLTE calculations
- Most of them capable of multi-line inversions

ME codes

HELIX

(Lagg et al. 2004)

MILOS

(Orozco Suárez et al. 2007)

VFISV

(Borrero et al. 2011)

P-MILOS

(Cabrera & Bellot Rubio 2020)

LTE codes

SIR

(Ruiz Cobo & del Toro Iniesta 1992)

SPINOR

(Frutiger et al. 2000)

2D SPINOR

(van Noort 2012)

SIR-parallel

(Thonhofer, Bellot Rubio, et al 2014)

NLTE codes

NICOLE

(Socas-Navarro et al. 2015)

STIC

(de la Cruz Rodríguez et al 2018)

DESIRE

(Ruiz Cobo et al., 2022)

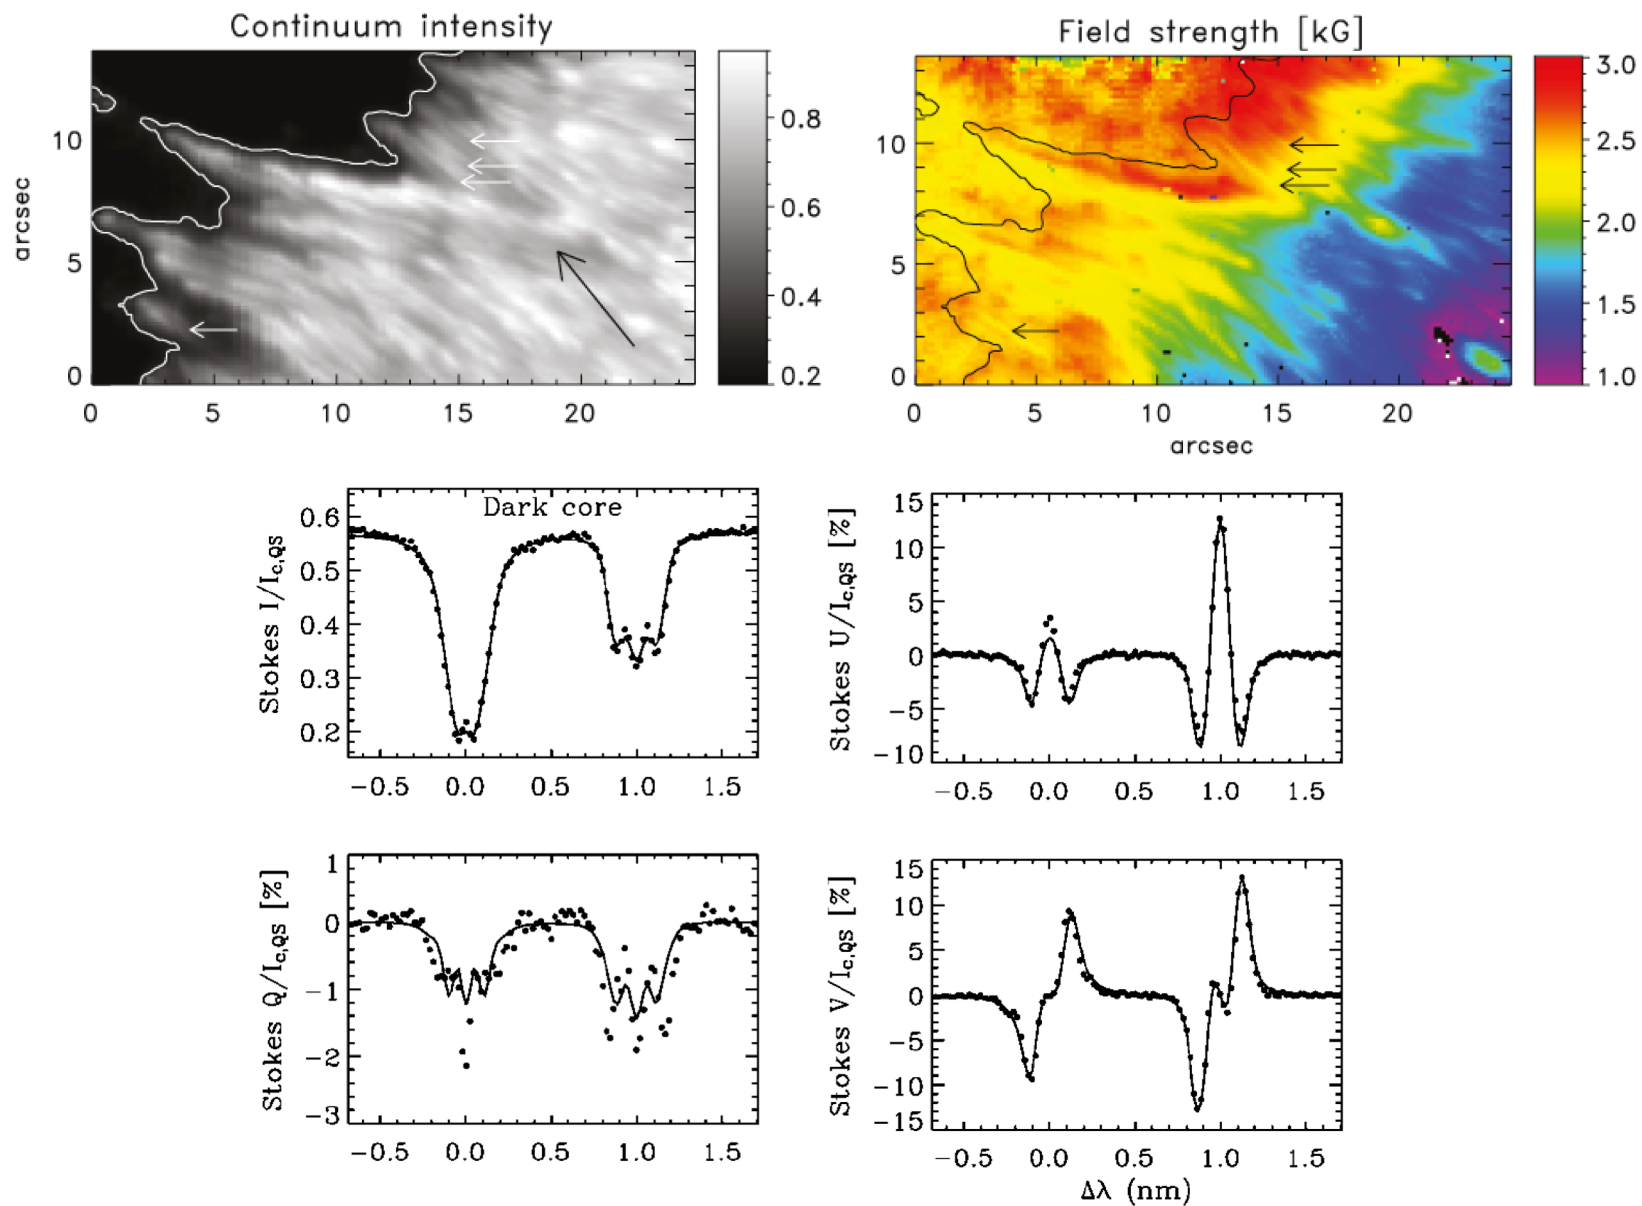

Tips and tricks

- **First of all, look at the profiles**
- Try a ME-like inversion, it usually works
 - If the V profiles are very asymmetric, fit only I, Q, and U
- Examine the fits: are they reasonably good?

ME inversion of QS Hinode/SP data

ME inversion of sunspot Hinode/SP data

Tips and tricks

- First of all, look at the profiles
- Try a ME-like inversion, it usually works
 - If the V profiles are very asymmetric, fit only I, Q, and U
- Examine the fits: are they reasonably good?
- Identify
 - Pixels with bad fits and/or large asymmetries
 - Regions where interesting physical processes occur!
- Run more complex inversions on these pixels
 - Which model are you going to use?
1C model, 2C model, flux tube model, uncombed model?

Tips and tricks

- First of all, look at the profiles
- Try a ME-like inversion, it usually works
 - If the V profiles are very asymmetric, fit only I, Q, and U
- Examine the fits: are they reasonably good?
- Identify
 - Pixels with bad fits and/or large asymmetries
 - Regions where interesting physical processes occur
- Run more complex inversions on these pixels
 - Which model are you going to use?
1C model, 2C model, flux tube model, uncombed model?
 - Use results from ME-like inversion as initialization
- Ask yourself if the retrieved model atmosphere makes sense!!
- Experts are always around: ask them for advice!

P-MILOS inversion code

P-MILOS is a parallel ME inversion code
(Cabrera & Bellot Rubio 2021)

- Highly optimized for speed
- Written in C
- Parallelized using MPI
- I/O based on FITS data cubes
- Control and auxiliary files have SIR-like format

- Accepts any photospheric spectral line (but only one!)
- 1-component ME atmospheres + stray light factor
- Convolution with instrumental PSF and macroturbulence

Installing P-MILOS

Download code and manual from

<https://github.com/IAA-InvCodes/P-MILOS>

Compile with

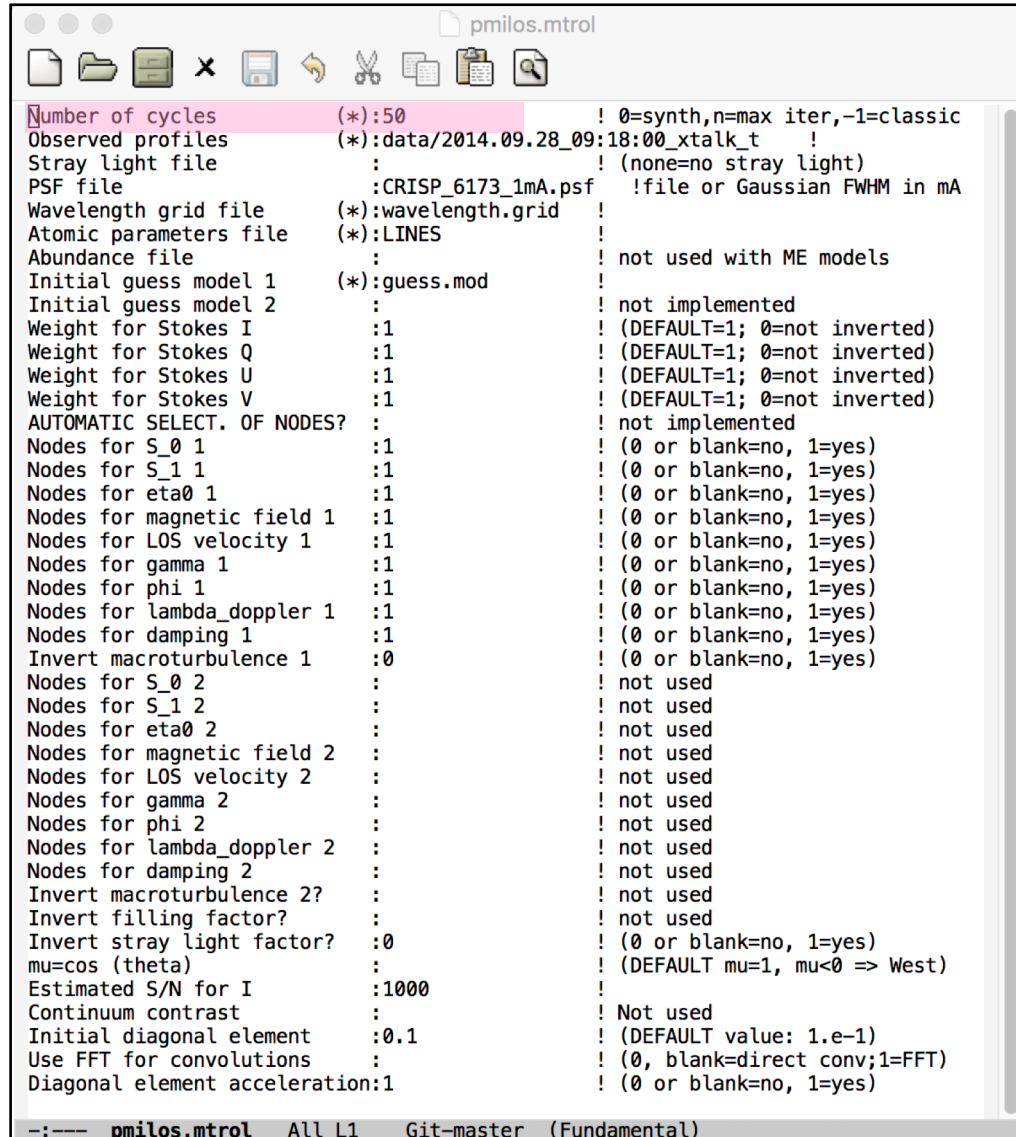

```
cd [path]/code  
make
```

Copy binaries pmilos.x and milos.x to /usr/local/bin or make soft links

```
cd /usr/local/bin  
sudo ln -s [path]/code/pmilos.x  
sudo ln -s [path]/code/milos.x
```

Running P-MILOS: input files

P-MILOS is controlled by a **control file**: [].mtrol

```

Stray light file

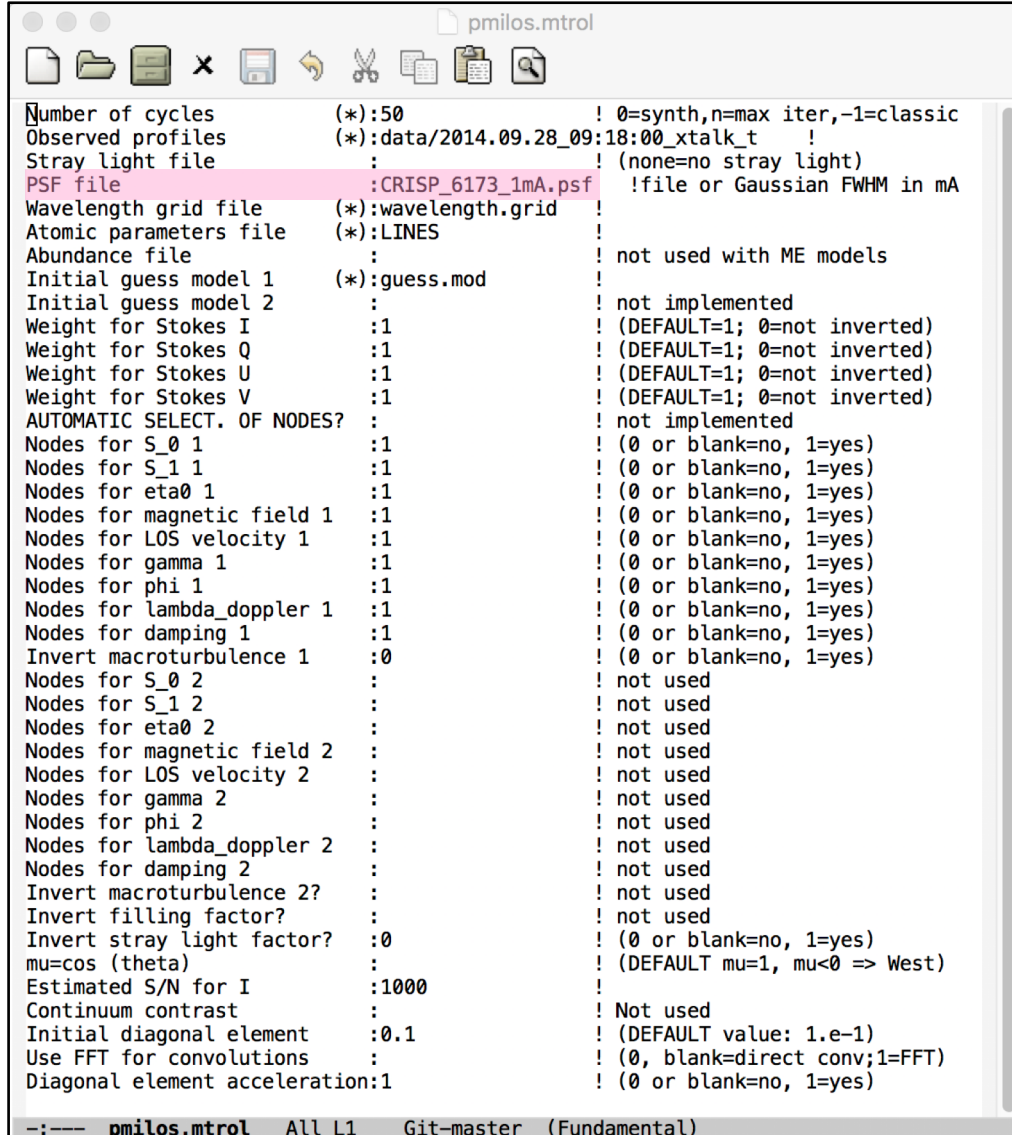

Same format as Stokes profile file.
Contains the stray light contamination,
assumed to be unpolarized (so that
 $Q=U=V=0$)

Stray-light considerations

- Stray-light in 1C inversions:
 - $I_{\text{obs}} = (1-\alpha) I_1 + \alpha I_{\text{stray}}$
 - Accounts for both stray light and/or magnetic filling factor
- Global vs local stray-light profile
 - Classical treatment: global stray-light profile (average over FOV)
 - Orozco Suárez et al. (2007): local stray-light profile accounts for telescope diffraction
- Deconvolution of instrumental PSF (only space-based obs!)

```

PSF file: [].psf

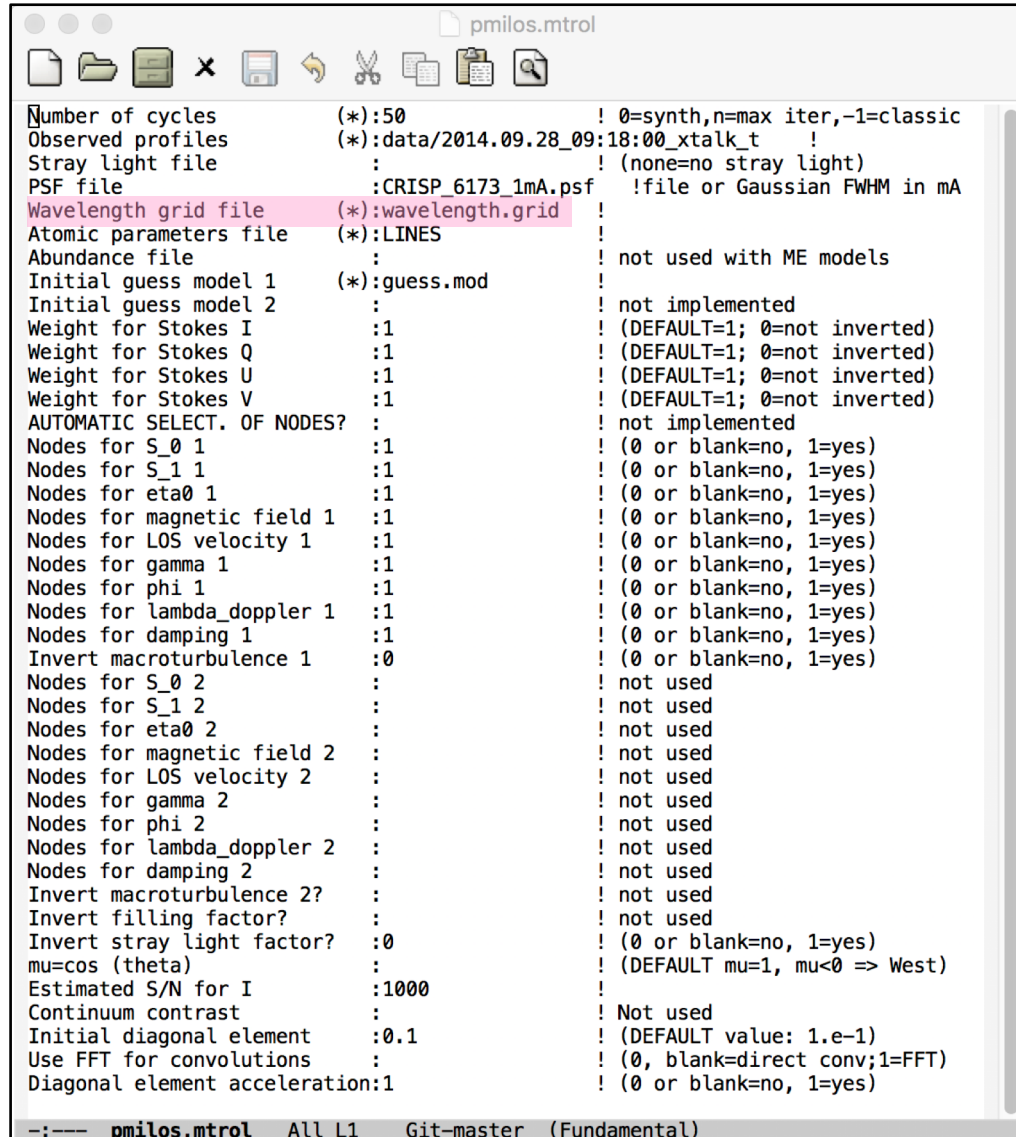

Contains two columns

1. Wavelength in mA with respect to center of the line
2. Spectral PSF of the instrument

Can also specify FWHM of Gaussian PSF (in mA)

```

Number of nodes

- Indicates which model parameters are kept fixed or inverted
- 0 means parameter is kept fixed
- 1 means parameter is inverted

- Only 1C model atmospheres can be handled for the moment

```

Other inversion settings

- Signal-to-noise ratio
- Initial diagonal element for SVD algorithm
- Use direct convolution of FFT convolution
- Acceleration of convergence scheme

Running P-MILOS: input files

The inversion of data cubes is controlled by an **init file**: [].minit

```
pmiilos.minit
Name of control file      (*):pmiilos.mtrot      !
Type of input profile    (*):fits                ! (fits)
Type of input straylight (*):fits                ! (fits)
subx1                    :0                ! (0 or blank=invert all pixels)
subx2                    :0                ! (0 or blank=invert all pixels)
suby1                    :0                ! (0 or blank=invert all pixels)
suby2                    :0                ! (0 or blank=invert all pixels)
outfile                  :results/inv_      ! (dir+prefix output files)
mask file                :                ! (mask for excluding pixels)
t1                       :20              ! (blank=dont invert timeseries)
t2                       :21              ! (blank=dont invert timeseries)
Save best-fit profiles    :0                ! (1 or blank = yes; 0=no)

```

File used to

- Specifies control file name
- Allows cropping of FOV
- Allows masking pixels
- Define first and last datacubes

- Similar to init file in SIR-parallel

Example

- Inversion of **data cube** taken by CRISP instrument at Swedish 1-m Solar Telescope
 - Fe I 6173 spectral scan with 30 wavelengths
 - Field of view 894 x 883 pixels (789 000 pixels)
 - Convolution with CRISP PSF
 - 9 free parameters to be determined (no stray light, no macro)
 - Maximum number of iterations: 50
- Code run on 128-core AMD EPYC 7742 2.25 GHz server

Executing the inversion

Run the inversion on 128 cores

```
mpiexec -n 128 ../P-MILOS/pmilos.x ./pmilos.minit
```

Executing the inversion

Run the inversion on 128 cores

```
mpiexec -n 128 ../P-MILOS/pmilos.x ./pmilos.minit
```

Total inversion time: 4.31 s

183 155 px/s = **1430 px/s/core**

S_0+S_1

Magnetic
field
strength
(Gauss)

Line of
sight
velocity
(km/s)

P-MILOS inversions

- Useful to analyze large amounts of data
 - High-cadence time series of 2D spectropolarimetric measurements
 - E.g. CRISP data at SST
- Give average vector magnetic field and LOS velocity. Can be used for statistical purposes
- Rather insensitive to noise
- Very fast and robust, can be applied without supervision
- Allows to **study temporal evolution!**

- Pixels with bad fits easily identified through large χ^2 values
- More detailed analyses can be performed on these pixels
- Useful as initialization for more complex inversions
